What Is The Difference Between A Tax Free Investment Company And A Mutual Fund? For those investors who want to save some money while making their investment decisions, it is recommended to make use of tax free investment options, such as Mutual Funds. A tax free investment is a type of investment that has been made using an account that is registered in the name of a person who does not pay tax, rather than to an account holder who pays taxes. Such an investment account will not be taxed as the funds are invested within the account. On the other hand, a mutual fund is an investment that is invested in securities that are owned by investors. The investment company or fund will pay an agreed price, known as a purchase price, to its investors, who will then use this money to buy the securities. Each investor will receive the agreed amount of shares of a particular stock or other investment in exchange for their contribution. The investor will then be able to trade the shares in the open market. The mutual fund will use a portion of the fund's profit for its investors, with the profit being used to pay the distribution costs to the investors. So, the cost of investing in a mutual fund is much less than the cost of investing in a tax free investment company. You can get your first choice of mutual fund with the Singapore Mutual Fund Association (SMA), which is made up of over 30 mutual funds. Tax-free investment companies can also be established in Singapore by following the setting up guidelines of the Company Registration Act. However, it is important to note that the investments made in a tax free investment company are not tax free. The tax on the profit that is made from the investments made in a tax free company will be paid when the income tax due is due for the year of investment. The tax free investment company can only be established in Singapore once it is fully registered. Therefore, this type of investment is not as widely available as a mutual fund. Steps to debug: 1- Start CMD in compatibility mode. 2- Open the Command Prompt as an administrator 3- Type the command: fsutil badfetch c:\ 4- Hit enter Q: How to copy one file to many directories? I'm trying to write a script that will copy a file (or several files) to several folders. I'm having trouble wrapping my head around this. I've tried the following: for i in \$(find. -iname "*" -exec dirname '{} ' \;); do cp \$i done When I run this script, I get the error: cp: invalid option -- m The goal is to copy a file from the current directory to several directories in the root. A: In your case, you are using the correct syntax for cp. The problem is that you are using the wrong arguments. The cp command that you're using doesn't take any options, but your code is doing something to the file name before passing it to cp. You can run this command manually (for example to create a single directory, using cp and no options) cp and see what is happening: \$ cp -v cp: invalid option -- m Try 2d92ce491b
