I can still access the instance of UIWindow.xib by accessing it via NSBundle mainBundle().URLForResource("coder0", withExtension: "xib")! I have a view controller that starts and ends up with an NSMutableArray of NSStrings. This is the object I am trying to access from an instance of UIWindow.xib. I create an instance of the view controller and set the NSMutableArray to nil: var coderViewController = CoderViewController() coderViewController.data = [] coderViewController.data.removeAll() And finally, I attempt to access the NSMutableArray of strings from a UIWindow I have set up in the storyboard: let coderViewController = UIViewController() coderViewController.view.addSubview(UIWindow.alloc().initWithFrame(self.view.frame)) coderViewController.view.window?.rootViewController = coderViewController coderViewController.data.append(txtStr) NSMutableArray which is nil: coderViewController.data.count My understanding is that UIWindow.alloc().initWithFrame() will instantiate the xib with an empty array. I have tried using alloc().init() as well and am met with the same results. I appreciate any input. A: According to the documentation, initWithFrame(_ frame: CGRect) is to be used with a UIViewController (inheriting from UIViewController). You are, however, initializing it with a UIView (that inherits from UIViewController), which is why you get that empty array. You could solve it either by inheriting from UIView instead of UIV

One gets the impression there's no discipline to it (at least, not in the US). While this weekly comic (that might be the lushest title ever) is definitely an homage to the superhero genre, this is anything but a watered-down, vanilla affair. If you're not up to reading all 22,000+ words about the story of these crazy characters, feel free to skip to the end of the page for the full reveal. As far as others go, there are a bunch of them on Twitter. Also, the Marvelous Mrs. Mallard is a wonderful source for most, as are the Shillington Art Club. Work Time Recorder is a simple, reliable and easy to use timer. It records and shows you the duration of a task or event, allowing you to monitor your time usage and get a good overview of how your day goes. The application records your time consumption (1 min, 5 min, 15 min...) in text format, and allows to export this data to CSV or TXT files, to PDF documents, or to a standard database, such as Microsoft Access, DB2, MySQL, MS SQL Server, Oracle, PostgreSQL, etc. In addition to timing, you can track your time, during recording, using one of the following sliders: days (1 day, 1 week), time (1 hr, 1 week, 1 month, 1 year), or time per project. Main features: - Timer recording - Export options (CSV, TXT, PDF, standard database) - Export option (time per project) - Printing (one-project PDF report) - Support for: Win7/2008, WinXP/2003 TortoiseHG is the extension of the *Mercurial* open-source client. It builds on top of TortoiseHg and aims at making version control easier for non-developers. Although TortoiseHG is not a hg command line tool, TortoiseHg can of course still be used as such. It is in most ways complementary to TortoiseHg and allows for pushing commits to repositories, branching and merging and so on. The main difference between TortoiseHG and TortoiseHg is that TortoiseHG aims at making the use of Mercurial much easier and better integrated with the user interface. TortoiseHg has many features, too many to list here. Please take a look at the website for more information. OK, so this is actually not the core of the application at all (it is not a pain), but just a sample application to show off the power of VSTS or Bamboo Agent.
